

# HR Analytics Dashboard — Problem Statement

Excel portfolio project

## Business Problem

HR teams need a clear way to understand employee attrition and identify workforce segments with relatively higher attrition. Raw employee records are difficult to interpret directly, so the data must be cleaned, validated, summarized and visualized.

## Project Objective

Build an Excel HR Analytics Dashboard that cleans employee data, calculates key HR metrics, analyzes attrition by multiple dimensions, and presents the results through PivotTables, PivotCharts, KPI cards and slicers.

## Key Business Questions

- How many employees are in the dataset?
- How many employees left and how many remain active?
- What is the overall attrition rate?
- Which departments, cities and job roles have higher attrition rates?
- How does attrition vary by age group, gender and education?
- Which areas should HR investigate further?

## Expected Outcome

A clean, validated and interactive analysis of approximately 1,149 employee records. The supplied dataset currently contains 508 Attrition=Yes and 492 Attrition=No records, subject to final data-quality corrections.

## Scope Limitation

The dashboard is descriptive. It identifies patterns in the supplied data but does not prove that a department, city or employee characteristic causes attrition.
